Drainage systems

We always
do the same:
forge new paths.

What do you do when a material doesn't have the desired properties?

– You develop the technology to adapt it. –

For decades, drainage systems have been manufactured from concrete, polymer concrete, steel or plastic, and none of the materials was ever able to meet our high requirements. They were either too heavy, too sensitive or not sufficiently environmentally friendly.

But after reading a specialist magazine in 2002, Friedrich Graspoiner announced:

„Our dream of both light and stable concrete channels can become a reality!“

After that, we were the only representative of our industry to invest in research and development of a substance which would ultimately combine the properties of cement and resin free cements with one another. Eight years and countless hours of hard work later, we had finally reached our goal: FILCOTEN® was born, and to this day continues to be the only material of its type.

The material history of channel manufacture

Innovation without sustainability is not innovation.

Our products are in direct contact with the earth's water cycle.

We have been asking ourselves the question of how advancement and sustainability can be combined for many years. We therefore set one additional goal when developing FILCOTEN®:

„It should be really environmentally friendly.“

We are very proud of the fact that we were very much able to achieve this. FILCOTEN® is completely neutral for the environment from the manufacture through to full recycling, and does not have any negative effects on humans or nature.

Our energy mix also makes clear that we are serious when it comes to sustainability. We don't use fossil fuels for the most part, relying instead on renewable energies.

GRASPOINTNER
Sustainable innovation.

BG energy mix:

It's not just FILCOTEN® which is environmentally friendly -
our energy mix is too.

Strong but gentle to the environment:

FILCOTEN®

Impact strength and environment-friendliness are just two of the many features which make FILCOTEN® unique.

The material combines the positive features of stable concrete channels with the construction of resin free cements (light construction), and years after its introduction onto the market it is still unrivalled. FILCOTEN® complies with the EN 1433 standard.

Temperature, frost and UV-resistant

Since FILCOTEN® channels are made of resin free fibre composites, they react to changes in temperature in the same way as the surrounding concrete bedding. This achieves a continuous unit and a long service life for the channel system. Resistance to frost and de-icing salt down to -40° has been demonstrated (taking into account EN1433).

Improved impact stability

The high impact stability of FILCOTEN® ensures greater safety when handling and installing the channels.

100 % recyclable

The manufacturing and processing focus is on the conservation of resources.

There is none of the high energy consumption which is required, for example, to heat the tools in the production of plastic products.

Better still, FILCOTEN® is 100 % recyclable.

Tested by the soil and building materials testing facility in Linz.

Lower transport costs, swifter installation

Depending on the type of channel, FILCOTEN® channels are up to 70 % lighter than conventional concrete channels. This huge saving in terms of weight decreases the consumption of fuel, conserves resources and decreases the proportional CO₂ emissions. The lower weight also facilitates installation on site.

GRASPOINTNER
Sustainable innovation.

Adapted surface properties

The particularly flat inner surface of FILCOTEN® channels achieves the best flow characteristics and a high self-cleaning effect. The textured outer surface ensures perfect cohesion with the concrete bed.

Surface properties:

36µm	Polymer concrete
Glass fibre modified concrete	100µm
Concrete	170µm
* FILCOTEN®	

* This value is based on initial results. Final details will be published after completion of testing.

High compressive strength

The resin free cement material with a high proportion of fibres enables thin-walled channels with particularly high compressive strength. FILCOTEN® channels are therefore lighter yet highly resilient.

Compressive strength

Polymer concrete	90 N/mm ²
Glass fibre modified concrete	70 N/mm ²
Concrete	65 N/mm ²
FILCOTEN®	90 N/mm ²

0 % harmful substances

FILCOTEN® is free from artificial resins and solvents. This means that it is harmless to the environment and our employees even during production. FILCOTEN® channel bodies have been bioconstructively tested and are recommended on this basis by the IBR (Institut für Baubiologie Rosenheim GmbH).

Non-flammable

While plastics are flammable, the purely mineral mix of materials means that FILCOTEN® does not have a fire load.

Fire protection classes:

- ▶ Polymer concrete: B1 difficult to ignite
- ▶ Plastic: B2 normal combustibility
- ▶ Glass fibre reinforced plastic: B2 normal combustibility
- ▶ FILCOTEN®: A1 non-combustible

As light as it is stable.

FILCOTEN® light

Robust, dimensionally stable and yet still light enough for construction in urban green and open spaces – FILCOTEN® light is the compact, cost effective channel system for many different areas of use. It offers you all of the advantages of FILCOTEN® and is suitable to be laid with block paving stones, tiles and other surfaces.

FILCOTEN® light is resilient up to class C 250 (in accordance with EN 1433) and is also available in a smaller „mini“ version, with a lower construction height.

Slot inlays

Optionally for slot width 18 mm to the optical design.

Smooth surface

The surface of FILCOTEN® is smoother than concrete, ensuring the best flow and self-cleaning characteristics.

Safety seam

A sealable safety seam enables a sealed connection between the individual modules.

GRASPOINTNER
Sustainable innovation.

FILCOTEN® slot top

If the design is as important as the function, then the slot top is our first choice. This is suitable for architecturally demanding surfaces, and with a slot width of 12,5 or 18 mm it can be perfectly fitted into the alignment of slots on the surface.

Anchoring ribs

The innovative FILCOTEN® production and moulding technology made designing anchoring ribs, therefore ensuring a secure bonding with the surrounding concrete bed.

Areas of use

Particularly suitable for landscaping projects, terraces, balconies, garages, pavements, sports facilities, driveways, pedestrian areas and similar surfaces.

The retaining spring in the ductile iron mesh grating ensures a secure hold of the grate in the channel body.

FILCOTEN® slot tops

Slot tops are particularly suitable for architecturally challenging surfaces in which the design is just as important as the function.

The narrow slot width of 12,5 mm or 18 mm means that they can be perfectly fitted into the alignment of slots on the surface.

During the entire period of construction, the installation slot protection should remain in the slot top as this prevents deformation or contamination of the system.

The maintenance units are integrated into the channel thread. This does not damage the optics of the thread profile.

The recessed cover of the maintenance unit can quickly and easily be removed for cleaning purposes using a lifting grip.

In-/Outlet cross-section

If channels have a length of more than 2 meters, the water flows just as well with a slot top off as with a classic cover.

The reason:

The inlet cross-section of the slot top is - as the inlet cross-section of a classic cover - larger than the flow cross-section of the connected sewer pipe.

So always flows from the end only the amount of water, which allows the PVC pipe, regardless of the cover.

Additional **safety aspects** for channel & grate: **FILCOTEN® tec**

The FILCOTEN® tec channel system offers the superior characteristics of FILCOTEN® and supplements these with additional safety aspects. Anchoring ribs ensure a secure bonding with the surrounding concrete bed. The special design of the galvanised steel rails allows for secure grating locking with the fiX self-locking system. Adjacent covering surfaces can easily be attached to the edges of the rails. The FILCOTEN® tec mini is the shallow channel for limited heights applications. The channel system is resilient up to class C 250 (in accordance with EN 1433)

Areas of use

Optimal for installation in pedestrianised areas, parks, sports and leisure facilities, car parks and similar surfaces.

Load class C 250

Galvanised steel rails

The special design of the galvanised steel rails allows for secure grating locking with the fiX self-locking system.

Smooth surface

The surface of FILCOTEN® is smoother than concrete, ensuring the best flow and self-cleaning characteristics.

Safety seam

A sealable safety seam enables a sealed connection between the individual modules.

GRASPOINTNER
Sustainable innovation.

COMBee-design grating

Unique honeycomb and scaled surface structure design with central marking line, makes this grating ideal for aesthetic applications. Hydraulically optimized inlet sections and heel-proof for pedestrian areas. The Filcoten composite grating is 100% corrosion resistant, can be fully recycled and is UV, frost and heat resistant.

Anchoring ribs

The innovative FILCOTEN® production and moulding technology made designing anchoring ribs, therefore ensuring a secure bonding with the surrounding concrete bed.

Perfekt fit

Intelligently distributed fixing points both inside and outside of the rails guarantee a perfect bonding with the FILCOTEN® material.

on request!

A connection, that keeps our promises.

The various different fixing options for our grates meet the requirements of channel standard EN 1433. Furthermore, they also allow you to adapt the safety measures to your own specification.

The new fiX connection ensures a rapid, secure fixing of the grating while the option for protection against vandalism goes one step further.

More security on request: optional system to protect against vandalism (for NW 100, 150 and 200)

Step 1: Push the system to protect against vandalism into the fitting springs provided for this purpose until it snaps into place.

Step 2: Attach the grating as described for the fiX-connection below into the FILCOTEN tec/pro channel.

Step 3: Push the grating firmly into the channel until it snaps into place.

Step 4: Lock the system to protect against vandalism by twisting the bolt.

You can find a video on how to use this system on: www.bg-company.com

Simply secure: the four-point fiX connection

The new 'fiX-connection' enables a four-point quick release safety device for the grating in the channel. The fitting springs for each grate variant engage in the indent in the rail provided for this, and the grating is simply and securely mounted.

- The gratings are initially inserted on one side of the channel with an exact fit and are locked by means of a simple turning of the grate.
- When doing this, look out for the openings in the rail (see A) in which the studs of the system to protect against slipping engage.
- The fiX-connection fixes the gratings in the rail. These connections can be detached by tugging.
- The fiX-connection can be used with ductile iron and mesh grates.

FILCOTEN® tec

Accessories

Bottom outlet made of PVC sewer pipes - on site installation

Prefabricated DN 100 outlet opening

a) Odour trap for bottom outlet consisting of 3 pieces
b) Outlet pipe of foul-air trap is inserted into outlet opening from below before installation.

c) The two remaining parts complete the foul-air trap - finished!

FILCOTEN tec sump unit, L=500 mm, to fit NW

Sediment bucket in plastic for sump unit to fit NW - acts as a dirt trap

Retrofittable odour trap for sump unit DN 100 or 150
Installation: Insert the odour trap from the inside and connect with the sewage pipe.

Odour trap made of PVC bends for sump units - suitable for sump units with outlets DN 150/200

Front- /end cap for all NW

End cap with outlet for all NW

Front- /end cap
FILCOTEN tec mini

Anti-vandalism locking device for all gratings - except slotted gratings.
Required per grating: 2 pcs.

Detailed Description page 24

References

Only a heavyweight when it comes to features:

With our FILCOTEN® channel, you don't have to compromise quality or durability. It's stable yet lightweight, and can be adapted to suit your needs. FILCOTEN® is available with galvanized or stainless steel rails up to class E 600 (acc. to EN 1433). The cast-iron rail model is tested up to class F 900 (acc. to EN 1433). FILCOTEN® channels are also available in a shallow version with a lower overall height.

Load class E 600 / F 900

Applications

Because FILCOTEN® can handle a high load capacity, it is especially suitable for installation in industrial areas such as in factories, warehouses and garages. However, with its sleek good looks it can just as easily be used in public places like railway stations, and pedestrian or residential areas.

Rail variants

The FILCOTEN® pro channel system is available with various integral rails made of galvanized steel, stainless steel or cast iron.

Channel geometry / smooth surface

The optimised channel geometry and the smooth surface ensure maximum flow and self-cleaning effects.

Vertical outlet on every channel

Every channel body has a vertical outlet possibility.

Sealant groove

Sealant groove for waterproof installation.

GRASPOINTNER
Sustainable innovation.

Bolted iron grip

As an alternative to the fiX closure, the bar grating can include up to cl. E 600 kN, and the slotted grating can include up to cl. F 900 kN, with 4 point bolting in to the cast iron rail. Corresponding gratings are available depending on the diameter. All fittings are supplied as a kit.

Our fittings are simple and easy to change. The cage nuts are replaceable and securely fit in the cast iron rail.

1) With cast-iron edges, tested up to cl. F 900 kN acc. to EN 1433.
Installation according to the manufacturer's installation instructions!

2) With galvanized or stainless steel edges, tested according to EN 1433 cl. E 600 kN.

3) for side and bottom drilling - details below

Channel body with lateral outlet

A drain hole DN 100 is possible at any point.

The position of sided drilling (left / right) can be selected.

Different diameters depending on the nominal width:

max. sided drilling diameter	
NW 100	ø 86 mm
NW 150	ø 130 mm
NW 200	ø 180 mm

T-pieces or train crossings can be produced easily and quickly.

For questions, please contact our application engineering department.

FILCOTEN® pro

Nominal width 100 - load class E / F

1. Mesh grating MW 30/10
cl. B galvanised steel, cl. C galvaniz.
or stainless steel V2A

2. Mesh grating MW 25/10
cl. D galvanised or
stainless steel V2A

3. Slotted grating SW 8/80
cl. C galvaniz. or
stainless steel V2A

4. Perforated grating
Ø 6,0 mm, cl. C
galvaniz. or stainless steel V2A

5. Design grating „Rallye“
on request

5. Design grating „Rays“
on request

5. Design grating
„your design“
on request

6. COMBee-design grating
hole diameter 7,3 mm
cl. C

7. Ductile iron elongated
bar grating, narrow slot
MW 29/6, cl. C

7. Ductile iron elongated
bar grating
MW 29/13, cl. C or cl. D

7. Ductile iron elongated
bar grating
MW 28/9, cl. D

8. Ductile iron
slotted grating
SW 14/100, cl. E

9. Ductile iron elongated
bar grating
MW 22/13, cl. E

*4-point bolting, only
available in cast iron edge

10. Ductile iron slot. gr.
SW 14/100, cl. F

*4-point bolting, only
available in cast iron edge

11. Slot top, cl. C (cl. D on request)
SW 12,5 mm / 18 mm, SH 110 mm
galvanised or stainless steel V2A

The **greener** solution with the

FILCOTEN[®] green

GRASPOINTNER
Sustainable innovation.

FILCOTEN® channels are continuously being developed. Our new FILCOTEN® green channel system is not only particularly environmentally friendly in terms of its manufacture and during operation, but it is also able to free rainwater, which in many places is polluted, from harmful substances as far as possible, before it re-enters the water cycle. This is a solution which has been desirable for quite some time, as rainwater which seeps into the ground in the area is the best for the environment.

Thanks to an ingenious multi-layer system made up of substrates and mechanical elements, FILCOTEN® green simply filters out everything that doesn't belong in the water cycle. To do this, FILCOTEN® green uses well-engineered substrate technology – the result of many years of research and development. In this way, each channel becomes a little sewage treatment plant in which organic and inorganic impurities are broken down or held back in the substrate. The channel system is based on our FILCOTEN® pro 300 and is resilient up to class F 900 kN (acc. to EN 1433).

Substrate channels

FILCOTEN® green

FILCOTEN® green filters organic and inorganic impurities out of rainwater before they re-enter the water cycle through the floor drainage. You can find details about construction and how it all works on the next page.

Grates

A selection of galvanised steel mesh gratings and ductile iron gratings are available. The gratings are available with bolted locking or with fiX self-locking system.

End cap

For waterproof closure of the channel. Available with horizontal outlet connection or closed endcap.

Front cap

The front cap close the channel run.

Vertical outlet

The outlet re-enter the cleaned water into the water cycle.

FILCOTEN® green

The technology behind it

1. Mesh grates made of galvanised steel or ductile iron longitudinal bar grates resilient up to class F 900 kN

The rainwater polluted with fine and coarse dirt comes into contact with the channel for the first time. Oversized dirt particles are mechanically stopped by the grate.

2. Reservoir for surface water

If there is heavy rainfall, excess surface water can be collected here and is only fed into the cleaning system gradually.

3. Coarse dirt sedimentation level

Coarse dirt which makes it through the grate is mechanically held back by this sedimentation unit. The hydraulically optimised overflow of the sedimentation level sits in a central location, achieving an optimal, even distribution of the feed-in medium above the substrate zone. The level of effectiveness is increased considerably.

4. First substrate layer: ENREGIS/Cleancalith A

This natural mineral mixture filters organic dirt loads from the polluted rainwater. It reduces the proportion of particulate, particle-bonded and dissolved substances through filtration, absorption, degradation, precipitation and complexation.

5. Second substrate layer: ENREGIS/Cleancalith B

Heavy metals and other inorganic compounds are removed or held back by this synthetic granulate. It is environmentally sound to an unlimited extent.

6. Hydraulic separating fabric

This material holds residual fine substances back, preventing them from getting through the underlying spacers in the flow area.

7. Trapezoidal spacers

These separate the substrate zone from the flow area, thereby creating a permanently free cross section in the channel.

8. Extremely stable channel bodies made of FILCOTEN®

The unique material FILCOTEN® is both extremely impact resistant and environmentally friendly. You can find more information about this on pages 6 and 7.

Installation guidelines

The following installation guidelines and examples are designed to use for an accepted standard. The load class and the installation location according to EN 1433 have to be adapted to the location conditions from the planner. Consider the common known technical rules and guidelines which are accepted among experts.

1 BG concrete drains are set up in a concrete foundation according to Ö-Norm B4710-1 or in drainage-concrete according to RVS 08.18.01. Mind the slope of the channel while excavating. Each channel is marked with an arrow showing the direction of flow – see the table below for details and measurements.

2 For a traffic-safe fastening of the grates we recommend, depending on the application area, to use grates with a quick-locking system or in conjunction with locking- or fixing-clips. According to Ö-Norm EN1433 from cl. D 400 kN there is to use preferably a locking device e.g. bolting material.

3 The rebated joint between the channel bodies can be sealed and cemented with appropriate sealing compounds - for description of material and quantity calculation see - BG sealing system.

4 Before assembling the adjacent cover layer make sure that the gratings are inserted and if necessary fixed or the channels are braced adequate against compression. Pay attention not to damage the channels while compacting the superstructure and the pavement (asphalt, pavement, concrete).

5 If there are occurring horizontally forces (e.g. due to concrete areas, gradients,...) you have to build out an adequate running joint at an interval of 30 - 200 cm from the channel. In a concrete area where there are running joints crossing the channel line they have to be arranged to go through a rebated joint of the line.

6 All adjacent surfaces should be permanently 3-5mm higher than the surface of the channel/grate to avoid mechanical damage (e.g. snow clearing) and to guarantee the water drainage.

7 In areas that were enhanced chemical attacks (eg, de-icing salts, acids, bases, etc.) can be expected, we recommend to install drainage channels with stainless steel edge or to use steel-channels out of stainless steel with high quality.

8 Drainage channels are not suitable to use across the road on motorways and highways.

The installation instructions also apply to sump units.

*Required minimum quality strength concrete, which has to be adapted to the local requirements.

ATTENTION: Acceleration, braking and torque forces must be taken in consideration for product selection and installation. Installation must be performed according to the installation instruction. Technical specifications are subject to change without further notice.

INSTALLATION EXAMPLES

FILCOTEN light:

- load class C 250 kN
- Paving stones or plates can be laid directly up to the channel body and no concrete edges are visible
- The grates can be fixed with locking- and fixing clips.

FILCOTEN tec/pro:

- load class C 250 kN (tec) or E 600 kN / F 900 kN (pro) - depending on the channel type
- Optimum machining of adjacent coating surfaces to the edge
- If there are occurring horizontally forces you have to build out an adequate running joint at an interval of 30 - 200 cm from the channel.
- According to Ö-Norm EN1433 you have to use preferably a locking device e.g. bolting material for grates up to cl. D 400 kN.
